RF12 programming guide

1. Brief description

RF12 is a low cost FSK transceiver IC witch integrated all RF functions in a single chip. It only need a MCU, a crystal, a decouple capacitor and antenna to build a hi reliable FSK transceiver system. The operation frequency can cover 300 to 1000MHz.

RF12 supports a command interface to setup frequency, deviation, output power and also data rate. No need any hardware adjustment when using in frequency-hopping applications

RF12 can be used in applications such as remote control toys, wireless alarm, wireless sensor, wireless keyboard/mouse, home-automation and wireless data collection.

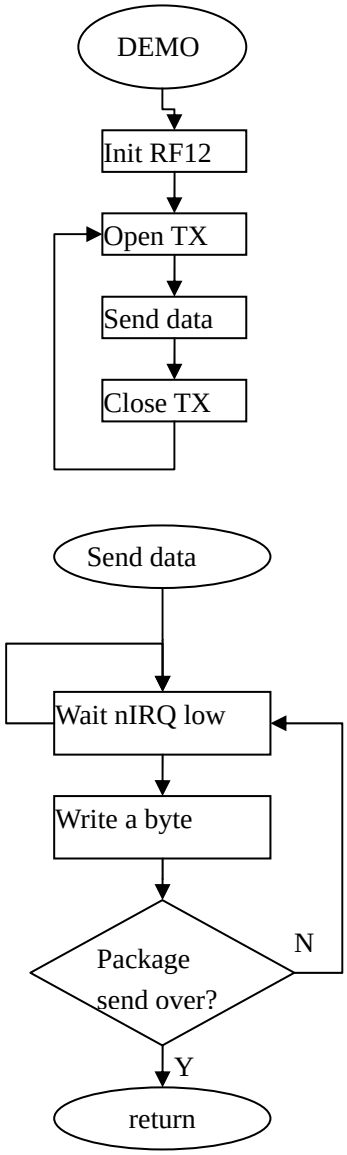
This command starts with a 0 and be used to read internal status register

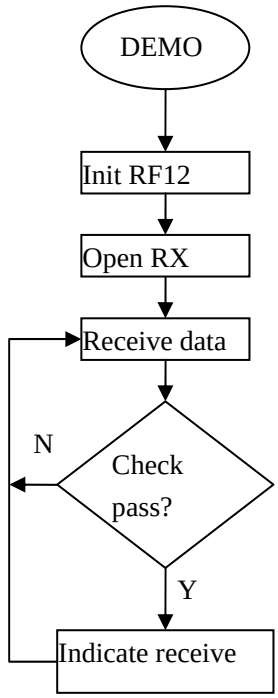
3. Demo flow diagram

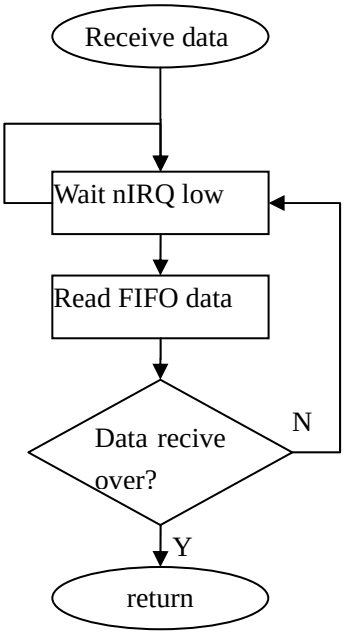
Transmitter:



Note: Initialize RF12 and open transmitter, RF12 will transmit a byte and pull nIRQ low when transmit over, then MCU can write next byte to transmit

Receiver:





Note: After RF12 initialization, Open FIFO receive mode and wait nIRQ low, only then MCU can read received and stored in FIFO data. For next package receive, please reset FIFO.
